LUXE & THREAD · DOCUMENTATION

INTERNAL – for developers

Internal 06 · Troubleshooting – Payments & Refunds

Audience	INTERNAL – support & developers
Use when	a customer says "I paid but…", "payment failed", "refund not received", or the owner sees mismatches

1 · How a payment travels (so you know where to look)

Evidence exists in **four** places – always check them in this order: | # | Where | How | What it proves | |---|---|---|---| | 1 | **Our order record** | Admin → order → *Event log*, or SQL below | what our system believes | | 2 | **Our logs** | `pm2 logs …` | errors with request ids | | 3 | **Razorpay dashboard** | Transactions → Payments (search payment id / order id / e-mail) | what the money did | | 4 | **Razorpay webhook log** | Account & Settings → Webhooks → event log | whether Razorpay reached us and our answer code |

2 · Commands

Purpose	Command	How to read it
Order + payment fields	`psql "$DATABASE_URL" -x -c "select id,status,payment_status,razorpay_order_id,razorpay_payment_id,failure_reason,total,refunded_amount from orders where id='LT…'"`	`payment_status` CAPTURED = we recorded the money

Purpose	Command	How to read it
Order events	`psql "$DATABASE_URL" -c "select at,type,message from order_events where order_id='LT…' order by id"`	look for `PAYMENT_CAPTURED`, `PAYMENT_FAILED`, `LATE_PAYMENT`, `REFUND`, `REFUND_FAILED`
Webhook activity	`pm2 logs luxe-thread --lines 3000 --nostream | grep -E "webhook.razorpay"`	`failed` + `INVALID_SIGNATURE` = wrong secret
Signature failures	`… | grep INVALID_SIGNATURE`	
Provider rejections	`… | grep -E "razorpay (order creation|refund) rejected"`	log contains Razorpay's own reason
Paid in Razorpay but not in our DB	compare Razorpay *Captured* list with `select id,razorpay_payment_id from orders where payment_status='CAPTURED'`	any payment id missing in our DB needs **redelivery** (§4)
Orders stuck unpaid	`select id,created_at from orders where status='PENDING_PAYMENT' order by created_at`	older than 30 min should be `CANCELLED` (cron job); if not, run expiry job
Run expiry manually	`curl -X POST -H "x-jobs-secret: $JOBS_SECRET" https://host/api/jobs/expire-orders`	`{"expired":n}`
Validate API keys	`curl -s -o /dev/null -w "%{http_code}" -u "$RAZORPAY_KEY_ID:$RAZORPAY_KEY_SECRET" https://api.razorpay.com/v1/orders?count=1`	200 ok / 401 wrong
Health	`curl -s https://host/api/health`	`razorpay:true`

3 · Symptom → cause → fix

Symptom	Likely cause	Fix
Payment window doesn't open	`checkout.razorpay.com` blocked (ad-blocker/firewall); CSP enforced without Razorpay domains	disable blocker; allow domains in CSP
"Online payment is not configured yet" (503)	key id/secret empty	set env, restart
"payment provider could not start this payment" (502)	wrong/expired key, test key + live account, Razorpay outage	check log line `razorpay order creation rejected` (`providerMessage`); §2 key check; Razorpay status page
"Sorry – X just sold out" at pay time	last piece bought by someone else between bag and pay	expected; customer picks another size
Customer paid, order **Awaiting payment**	verify call failed **and** webhook missing/failing	Razorpay webhook log → find the event → fix secret/URL → **Redeliver**; order flips to PAID
Order **Cancelled** but customer paid	paid after 30-min expiry	system records `LATE_PAYMENT` and **auto-refunds**; check `REFUND` event; if `REFUND_FAILED`, refund manually (§5)
`INVALID_SIGNATURE` on `/api/checkout/verify`	key id/secret from different modes	use matching pair
`INVALID_SIGNATURE` on webhook	webhook secret differs / proxy altered body	re-enter secret (both sides); Nginx must not modify body
Webhook "not reachable"	URL not public/HTTPS, firewall	fix DNS/443; for local use tunnel
Payment stays "authorized" then refunded by Razorpay	capture mode manual	set automatic capture
Same payment twice in events	verify + webhook both arrived	harmless (idempotent)
Two payments for one order	customer retried after a failed attempt and both captured	refund the extra one in Razorpay dashboard
Amount differs from the page	price/sale changed after order creation	orders keep price at purchase time
Failed payment then success	normal retry	`PAYMENT_FAILED → PAID` is allowed

4 · Recovering a paid-but-unrecorded payment

1. Razorpay dashboard → payment → copy **order id** (`order_…`) and **payment id**.
2. Webhooks → event log → open the `payment.captured` event → **Redeliver**. Expect 200.
3. If the log shows `INVALID_SIGNATURE` : fix `RAZORPAY_WEBHOOK_SECRET` , restart, redeliver.
4. If redelivery is impossible: `curl` §2 of the Config guide (5.2) is for tests only – **do not** forge production events. Instead mark in Admin by creating the shipment only after confirming the capture in Razorpay, and ask the developer to confirm

the payment via SQL in a transaction (`update orders set payment_status='CAPTURED', status='PAID', razorpay_payment_id='pay_…'`) plus an `order_events` row `MANUAL_FIX`.

5. Verify: order shows PAID, customer received confirmation (Admin → Messages).

5 · Refund problems

Symptom	Cause	Fix
Admin refund error "no online payment to refund"	order is COD, unpaid, or already fully refunded	check `payment_status`
"Refund must be between ₹1 and ₹..."	more than remaining	enter ≤ remaining
`REFUND_FAILED` event	Razorpay rejected (insufficient balance in settlement account, payment too old, already refunded)	read the message; Razorpay dashboard → Payments → refund manually; add a note; retry later
Customer: "no refund yet"	refunds take 5–7 business days to reach bank	show them refund id from Razorpay (`rfnd_…`)
Refund created in dashboard manually	our DB doesn't know	add event / update `refunded_amount` (ask developer)

Check refunds: `select amount,status,razorpay_refund_id,reason from refunds where order_id='LT…'`.

6 · Daily reconciliation (5 minutes)

1. Razorpay → Payments (yesterday, *Captured*) → count N and ₹ total T.
2. `select count(*), sum(total) from orders where payment_method='PREPAID' and payment_status in ('CAPTURED','PARTIALLY_REFUNDED','REFUNDED') and created_at::date = '<date>'`.
3. N and T should match (ignore timezone edge: compare in IST). Differences → §4.
